

Patterns as Building Blocks

Tuesday, July 27, 2021 11:35 AM

How can we combine the patterns?

<p>Patterns might be able to</p> <ul style="list-style-type: none"> Combined in parallel <ul style="list-style-type: none"> Patterns combined in the foreground and background manners Combined in sequential order 	 <p>Expand</p>	 <p>Integrate</p>	 <p>Clone</p>	 <p>Migrate (transition & merge)</p>	 <p>Partition</p>
 <p>Expand</p>		<p>Expand -> Integration: Working on some mapping with whiteboard (expand) then need to share the whiteboard in a teams meeting.</p>	<p>Expand (foreground) & Clone (background): Designing a poster and listening to music (launch spotify on multiple devices).</p> <p>Expand -> Clone: Designing a poster then need to present in a meeting (project to the screen).</p>	<p>Expand -> Migrate: Working on a poster design then need to travel so need to migrate the work to the laptop.</p>	<p>Expand -> Partition: Finish most important part of the poster design then want to check some social media while working so exit expand mode move back to partition mode.</p>
 <p>Integrate</p>	<p>Integrate -> Expand: Attending a meeting then need to focus on editing the meeting note.</p>		<p>Integrate (foreground) & Clone (background): Running a meeting with different devices input/output distributed, but have message app open up on all devices to be able to chat with friends when attending the meeting.</p> <p>Integrate -> Clone: Finish working on a presentation then need to discuss the working draft with collaborators.</p>	<p>Integrate -> Migrate: Attending a meeting then need to grab just the audio and run an errand Working on a slide deck then move to just laptop and move to living room from office just to edit text.</p>	<p>Integrate -> Partition: After the meeting, can go back to the multitasking mode with social media, chats, and other apps open up.</p>
 <p>Clone</p>	<p>Clone -> Expand: Discuss a paper draft with collaborators in a meeting (mirrored screen) then go back to paper editing after the discussion.</p>	<p>Clone -> Integrate: Discuss a paper draft with some colleagues for getting feedback, then talk with remote co-authors to discuss the changes based on the feedback.</p>		<p>Clone -> Migrate: Finish presenting the screen, go back to edit some of the document from the meeting's feedback.</p>	<p>Clone -> Partition: Finish presenting the screen, now can have other non-work related apps show up on other devices</p>
 <p>Migrate (transition)</p>  <p>Migrate (merge)</p>	<p>Migrate -> Expand: After doing some sketches on the tablet, need bigger screen spaces to work on detailed coloring of the sketches, so moved to the workspace with multiple monitor setup for detailed work.</p> <p>Merge -> Expand: After doing idea sketches on all different devices, need to consolidate all ideas, so move to workspace to have a bigger canvas and synthesize ideas.</p>	<p>Migrate -> Integrate: Attending a meeting from the phone when get to the office, can actually launch the slide show on the computer and note taking on tablet and keep audio on the phone to continue the meeting</p>	<p>Migrate -> Clone: Working a deck on the laptop then need to migrate to a work laptop and mirror the screen to the projector in the meeting room</p>		<p>Migrate -> Partition: Have several apps open on the phone - reply to email, chatting with friends and reference a document when running outside; after the running, can have those work related apps move to laptop, but chatting with friends stay on the phone</p>
 <p>Partition</p>	<p>Partition -> Expand: After writing an outline, need to finish writing the draft, expand let make all space focused area and hide unrelated stuff.</p>	<p>Partition -> Integration: Transitioning from work on multiple tasks to focused meeting mode (need to use all devices for a meeting)</p>	<p>Partition -> Clone: Multitasking on the laptop, then need to share screen when discuss some work with the manager (clone should only share relevant tasks)</p>	<p>Partition -> Migrate: At the end of the work day, take only personal tasks with the laptop when moving from the workspace at the office to the couch in the living room</p>	

Quick Notes:

- Adaption in transitions
- Hide/Show relevant/irrelevant stuff in transitions (prioritization)
